

February 2021

Hi Everyone.

This is Beda Dondi with your February (late) update of the Aquatic Center rebuild.

Construction at the Aquatic Center is making huge progress as much of the infrastructure (electric, filtration and foundations) is in the ground and being assimilated to what will be eventually above ground.

Just inside of the main entrance the new 10" waterline is in its final phases and will connect to the facility water supply.

Looking West

Looking east.

Just a quick quiz for those not in construction: Do you know the name of this safety device? Answer at the end of blog.

Progress on the South Bleachers is looking recognizable with the individual seats now poured and very solid.

This picture was taken several weeks ago, but it shows the forming process nicely.

The diving well is making great progress with pouring of the swim out stairs...

and lots of steel going into the dive tower foundation.

Can you tell this tower is going to be substantial?

The gutters for the competition pool and the training pool are being set, bolted and surrounded by concrete to almost art in my opinion.

Interior of the Vault room we will likely never get to look at again but incase you are curious.....

And finally answer to the quiz: When digging a trench where people will be 4 feet deeper than level grade you want to use a Trench Box to keep the hole open and the workers safe from collapses.

That is it for this month. I will make an effort to get the next installment out at the BEGINNING of March rather than this tardy version

Thanks for reading and think “swimming”.

Beda
