

FIRST-OF-ITS-KIND STUDY SHOWS SWIMMERS GAIN AN ADVANTAGE WHEN THEY RECOVER WITH CHOCOLATE MILK

5/29/2014 – FROM USASWIMMING.ORG

Grabbing chocolate milk after a hard swim could give swimmers a performance edge, according to new research presented at one of the nation's top sports medicine conferences – the American College of Sports Medicine's annual conference. In a sport where seconds and even tenths of a second can make a big difference and intense practice routines are the norm, Indiana University researchers found that when collegiate, trained swimmers recovered with chocolate milk after an exhaustive swim, they swam faster in time trials later that same day. On average, they shaved off 2.1 seconds per 200 yard swim, and 0.5 seconds per 75 yard sprint, compared to when they recovered with a traditional carbohydrate sports drink or calorie-free beverage.

“Chocolate milk is an ideal recovery drink. It's a ‘real food,’ has the right carb to protein ratio athletes need and it's less expensive than many alternatives,” said Joel Stager, PhD, lead researcher at Indiana University. “From cyclists to runners to soccer players, there's a strong body of research supporting the benefits of recovering with chocolate milk. Now, our research suggests these same benefits extend to swimmers – a sport that relies on quick recovery for multiple races within a single day.”

The study is the first to test the benefits of chocolate milk in swimmers, and included six division one collegiate swimmers performing a muscle fuel (glycogen)-depleting swim bout of 60 x 100 yards followed by five hours of recovery for three consecutive weeks. The athletes then recovered with one of three randomized beverages –reduced fat chocolate milk, commercial carbohydrate sports drink (with the same calories as the chocolate milk), or calorie-free beverage – immediately and two hours after the swim. Following the five-hour recovery period, three swim performance test sets were completed relying on aerobic (200 yards), anaerobic (75 yard sprint) and immediate energy metabolism (10 meters against resistance). While there were no differences in the immediate energy metabolism swims, there were significant differences in the aerobic and anaerobic swims – indicating better recovery after drinking chocolate milk.

ELITE SWIMMERS TRUST CHOCOLATE MILK

Elite athletes, coaches and serious exercisers have long recognized the benefits of lowfat chocolate milk. The beverage has been a staple on the training menu of swimmers for years – and the proof is in the pool.

“Our athletes know that chocolate milk makes a difference – it's long been a part of many elite swimmers' recovery routines,” said Frank Busch, National Team Director of USA Swimming, the national governing body of competitive swimming in the U.S. “These findings are so significant for our athletes. Fractions of a second can decide a win or a loss in competition – so chocolate milk will likely be even more prominent on our athletes' training tables as they gear up for Rio.”

With more than 20 studies supporting the benefits of recovering with the high-quality protein and nutrients in chocolate milk after a tough workout, this research is the first of its kind in swimmers, and adds to a growing body of evidence that supports the advantages of drinking chocolate milk after strenuous exercise. Chocolate milk has high-quality protein to build lean muscle, it has the right mix of protein and carbs to refuel exhausted muscles, plus it has fluids and electrolytes to help replenish the body.
