# Drowning Doesn't Look Like Drowning

iStock Photo/bingokid

One of the first things I ever wrote for publication was a short article about drowning recognition for a Coast Guard magazine. A few years later, I adapted the piece for recreational boaters. I tried my best to get it published, but no one wanted it. *Reader's Digest* said it was “too dark,” and everyone else (including *Soundings* magazine) simply ignored the submission.

Thanks to a friend of mine who had a blog, my piece on drowning was first posted eight years ago to the day in 2010. It went viral and crashed his website. Since then, it's been translated into 15 languages, was published in the *Washington Post*, and *Reader's Digest* eventually requested to buy the rights. After years of saying yes to requests to republish, repost and translate (there have been hundreds), I released the piece to the public domain. But I never got the article into a major boating magazine as I intended. Well, this is my blog, so I like my chances this time.

Summer is coming, folks, and I think the short article below is the most valuable thing I've put together, ever. I wanted to make sure followers of this blog have read it.

## **Drowning Doesn't Look Like Drowning**

The new captain jumped from the deck, fully dressed, and sprinted through the water. A former lifeguard, he kept his eyes on his victim and headed straight for a couple who were swimming between their anchored sportfish and the beach. “I think he thinks you're drowning,” the husband said to his wife. They had been splashing each other, and she had screamed, but now they were just standing neck-deep on a sandbar. “We're fine, what is he doing?” she asked, a little annoyed. “We're fine!” the husband yelled, waving him off, but his captain kept swimming hard toward him. “Move!” he barked as he sprinted between the stunned owners. Directly behind them, not 10 feet

away, their nine-year-old daughter was drowning. Safely above the surface in the arms of the captain, she burst into tears and screamed, “Daddy!”

How did this captain know — from 50 feet away — what the father couldn’t recognize from just 10? Drowning is not the violent, splashing call for help that most people expect. The captain was trained to recognize drowning by experts and years of experience. The father, on the other hand, learned what drowning looks like by watching television.

If you spend time on or near the water (hint: that’s all of us), then you should make sure that you and your crew know what to look for when people enter the water. Until she cried a tearful, “Daddy,” the owner’s daughter hadn’t made a sound. As a former Coast Guard rescue swimmer, I wasn’t surprised at all by this story. Drowning is almost always a deceptively quiet event. The waving, splashing and yelling that dramatic conditioning (television) prepares us to look for is rarely seen in real life.

Mario Vittone

The Instinctive Drowning Response, so named by Francesco A. Pia, Ph.D., is what people do to avoid actual or perceived suffocation in the water. And it does not look like most people expect it to. When someone is drowning there is very little splashing, and no waving or yelling or calling for help of any kind. To get an idea of just how quiet and undramatic drowning can be, consider this: It is the number two cause of accidental death in children age 15 and under (just behind vehicle accidents). Of the approximately 750 children who will drown next year, about 375 of them will do so within 25 yards of a parent or other adult. In 10 percent of those drownings, the adult will actually watch them do it, having no idea it is happening.

Drowning does not look like drowning. Dr. Pia, in an article he wrote for the Coast Guard's *On Scene* magazine, described the instinctive drowning response like this:

- Except in rare circumstances, drowning people are physiologically unable to call out for help. The respiratory system was designed for breathing. Speech is a secondary or overlaid function. Breathing must be fulfilled before speech occurs.
  - Drowning people's mouths alternately sink below and reappear above the surface of the water. The mouths of drowning people are not above the surface of the water long enough for them to exhale, inhale or call out for help. When the drowning people's mouths are above the surface, they exhale and inhale quickly as their mouths start to sink below the surface of the water.
  - Drowning people cannot wave for help. Nature instinctively forces them to extend their arms laterally and press down on the water's surface. Pressing down on the surface of the water permits drowning people to leverage their bodies so they can lift their mouths out of the water to breathe.
  - Throughout the Instinctive Drowning Response, drowning people cannot voluntarily control their arm movements. Physiologically, drowning people who are struggling on the surface of the water cannot stop drowning and perform voluntary movements such as waving for help, moving toward a rescuer or reaching out for a piece of rescue equipment.
  - From beginning to end of the Instinctive Drowning Response, people's bodies remain upright in the water, with no evidence of a supporting kick. Unless rescued by a trained lifeguard, these drowning people can only struggle on the surface of the water from 20 to 60 seconds before submersion occurs. (Source: *On Scene* magazine: Fall 2006 page 14)
- This doesn't mean that a person who is yelling for help and thrashing isn't in real trouble — they are experiencing aquatic distress. Not always present before the instinctive drowning response, aquatic distress doesn't last long,

but unlike true drowning, these victims can still assist in their own rescue. They can grab lifelines, reach for throw rings, etc.

Look for these other signs of drowning when persons are in the water:

- Head low in the water, mouth at water level
- Head tilted back with mouth open
- Eyes glassy and empty, unable to focus
- Eyes closed
- Hair over forehead or eyes
- Not using legs
- Hyperventilating or gasping
- Trying to swim in a particular direction but not making headway
- Trying to roll over onto the back
- Appears to be climbing an invisible ladder

So, if a crewmember falls overboard and everything looks okay, don't be too sure. Sometimes the most common indication that someone is drowning is that they don't look as if they're drowning. They may just look as if they are treading water and looking up at the deck. One way to be sure? Ask them, "Are you alright?" If they can answer at all, they probably are. If they return a blank stare, you may have less than 30 seconds to get to them. And parents — children playing in the water make noise. When they get quiet, you need to get to them and find out why.
